

WHO VERIFIES THE VERIFIER?

Who verifies the verifier?

UniPat represents an important layer: evaluating AI with real tasks, experts and rubrics. **But experts are not ground truth, a rubric is not reality, and a benchmark is only a proxy.** The next infrastructure layer is the trust boundary of verification itself.

Generation created the need for verification.
Verification is creating the next question: who verifies the verification?

THE EMERGING STACK

INVESTMENT THESIS

New scarcity Answers and scores become cheap. Scarcity moves to Provenance × State × Time × Boundary .	Core data asset Each verification leaves a time-indexed evidence state: counter-evidence, unknowns, non-inference limits and outcome feedback - not a disposable PDF.	Compounding loop More cases create reusable verification rules, state transitions and real-world outcomes; the next case researches only the missing evidence.
---	---	--

Verification ≠ Ground Truth.
StructEvidence gives every verified result an auditable boundary.
