

TRUST BOUNDARY

A verified result is still not a fact.

AI systems, experts and consultants can all produce “validated” conclusions. **But every validation depends on data, experts, rubrics, samples and a time window.** StructEvidence makes the boundary of that trust explicit.

UNIPAT ASKS

Did the AI perform correctly under this evaluation?

STRUCTEVIDENCE ASKS

Why should this evaluation represent reality? Where does trust stop?

EVERY “VERIFIED RESULT” SITS ON A DEPENDENCY CHAIN

StructEvidence does not create another score. We expose the TRUST BOUNDARY of the chain.

A result is not simply true or false. It is conditioned on evidence, scope and time: what supports it, what does not, what remains unknown, and what new observation must reopen it.

WHAT A SERIOUS DECISION NEEDS TO PRESERVE

01 • Provenance

Where did the expert judgment, dataset, vendor claim or AI output come from - and can it be independently checked?

02 • Boundary

How far does the evidence actually support the conclusion? Where does inference become overreach?

03 • Reopen

Freeze the state as-of the decision date, and define what new evidence must force a review.

If the conclusion proves wrong later, can you explain **what was trusted, why, and how far?**
